

The new Corona vaccination

Prof. Dr. Hockertz explains many, partly shocking details and facts about the vaccine, which will be used in Germany on a broad scale from 27th of Dezember onwards.

Here are key points from the interview, broadcasted in PUNKT.Preradovic, (german) (<https://youtu.be/RJue8CKkD8M>)

Prof. Dr. Stefan Hockertz:

studied biology in Hannover; PhD 1988. Thereafter he qualified as a university lecturer at university Hamburg for Toxicology and Pharmacology. 1986 till 2001 he researched at Fraunhofer-Gesellschaft Hannover.

2000 – 2001 he worked as a private lecturer for Toxicology and Environmental medicine in Hamburg and 2001 – 2004 as professor for molecular Immune-Toxicology.

2000 – 2004 he worked at Institution for experimental and clinical Pharmacology and Toxicology of the University-hospital Hamburg-Eppendorf. 2003 and 2004 Stefan Hockertz was the director of this institution.

- **"Assuming a 5% damage rate caused by vaccination, means: 4 mio people in Germany with a total 83 mio people in Germany; 4 mio peoples' health will be damaged through vaccination."**
- **"Based upon a poor developed Corona-mRNA-vaccine; we have to count on a vaccinated peoples' death rate of even 0,1% - which means 80.000 people will die."**
- **"A city like Bamberg or Konstanz, completely extinguished, because the vaccine was not developed „state of the art“."**
- **„Recently I contacted Mr Sahin, director of BioNTech, asking him to provide me the toxicological data based upon which human experiments are being carried out. But up to now I did not even an answer."**
- **„I have to assume, that no toxicology at all has ever been done."**
- **„I fear a massive intended thread of body damage, if the vaccine is not developed in a licensing process based upon rules, which normally takes about 8 years."**
- **"I also contacted the Paul-Ehrlich-Institute a few times, which is the federal institution for vaccines and biomedical drugs I Germany, and asked: „Where are the data records?“ Their answer was always evasively: „We don't have any."**
- **To develop a vaccine in such a short time and process exposes people to immense dangers.**
- **I disapprove the Corona vaccination because it is neither examined of its technical safety, nor tested of its toxicology or reasonably tested in clinical studies; this means, there is great danger for body and life. The risk for someone to get vaccinated is significantly higher than to get severely sick with Corona.**

How does a m-RNA vaccine work?

- Normal vaccines consist of weakened or dead causative organisms, which do not cause infections by themselves, but supply opportunity to the immune system to learn from it and to set up a protection against an infection within us. The mRNA vaccination is based upon an entirely new principle, which has never been licensed for the use in people before.
- In this, genetic material, namely messenger ribonucleic acid - mRNA - will be invented in human cells, there to be read. To be read is a spike-protein, which is exclusively produced from the Corona virus, and be shown on the human cells' surface, where it should lead the immune system to believe, that this is a Corona infection, so that it learns against it. That's the principle which stands behind the mRNA vaccination.
- We do not change the DNA, but we change the biosynthesis of the protein. We push body-own cells to produce a Corona typical protein. This is an intervention in the regulation of the organism of our cells, what has to be very careful and closely observed!
- An independent company treated 20 ferrets with a mRNA vaccine against Corona, 20 others were not treated, in a challenge experiment. Thereafter all ferrets were artificially infected. The 20 ferrets not treated with the vaccine got ill with the typical Corona pathology. The 20 vaccinated ones died instantly!
- This means, there is a potential high danger, gambling with a Corona virus, which is able to enforce the beginning of a paradox immune reaction.
- If people are getting vaccinated, they generally have to be healthy. We apply a toxin to a healthy person, so that the person's immune system can learn to fight this thing. So we have to be very careful and keep a keen eye on this system, so that the immune system does not overreact.
- In the case of the swine flu (H1N1), previously, the used vaccine caused an irreversible sickness in children, narcolepsy, in a significant number, so that later it was decided against the vaccination.
- Professor Bhakdi described very good in his new book, how our body fights against Coronaviruses; not by the means of antibodies, but by using cytotoxic T-cells, so to say killer-T-cells, which can not be reached with a vaccination. This means, here we got an immunologic happening, which in fact indicates an exclusion to vaccinate
